Continuation of 2. NOTE:

Regarding 09/531,633 by Applicant LI.

Applicant's proposed amendment asserts that certain Boolean simplicfication methods "do not work with slightly complex tautological checking methods because their failure to simplify a Boolean function to a constant does not mean all other methods must also fail".

Applicant's Remarks page 6 state that certain Boolean simplification methods "are not likely useful on complex Boolean functions...cannot be used to simplify well-designed multipliers in microprocessors, and therefore do not help in showing the equivalence of 2 slightly different (but both correct) multiplier designs... Karnough map is only useful for at least 4 or 5 variables..."

Thus, Applicant appears to be raising new issues (both by amendment and by assertion) regarding "complex Boolean functions" with more than 5 variables, asserting that certain methods disclosed in the prior art fail, and thus attempting to distinguish the claimed invention during potential failure conditions. These are new issues that require substantial further consideration and/or search. Specifically, the alleged conditions for failure of certain Boolean simplification methods is a new issue, and may also be new matter.

Applicant's other assertions are not persuasive.
